

VIVEK VAGADIYA

Frontend Developer · [React.js](#) · [JavaScript](#) · [MERN Stack](#)

vivekvagadiya47@gmail.com · +91 95744 10907 · Surat, Gujarat, India · [LinkedIn](#)

PROFESSIONAL SUMMARY

Frontend Developer with 1+ years of production experience architecting scalable React.js applications across HRMS, real-time betting, and enterprise service platforms. Specializes in Redux Toolkit state management, role-based access control (RBAC), REST API integration, and real-time data synchronization via WebSocket and Firebase. Proven track record of delivering reusable component libraries, performance-optimized UIs, and dynamic rendering systems that directly reduce development overhead and improve user experience at scale. Growing full-stack proficiency with Node.js and MongoDB.

TECHNICAL SKILLS

Languages: JavaScript (ES6+), TypeScript, HTML5, CSS3

Frameworks & Libraries: React.js, Next.js, Redux Toolkit, Context API, React Hooks, Axios

UI & Styling: Material UI (MUI), Tailwind CSS, Responsive Design, Component Lifecycle

Real-Time & Backend: WebSocket, Firebase (Realtime DB, Auth), Node.js, Express.js, MongoDB, REST APIs

Architecture & Concepts: RBAC, JWT Authentication & Authorization, Reusable Component Architecture, Performance Optimization, Scalable Frontend Architecture, Dynamic UI Rendering, MERN Stack

Tools & Platforms: Git, GitHub, Postman, VS Code, npm, Webpack

PROFESSIONAL EXPERIENCE

React.js Frontend Developer | **Prometteur Solutions Pvt. Ltd.** — Surat, India *Mar 2025 – Present*

- Architected and delivered reusable, responsive UI component library using React.js and Material UI, achieving consistent cross-device rendering across 5+ screen breakpoints and reducing per-feature UI build time by ~20%.
- Engineered a multi-role RBAC system supporting Admin, HR, and User permission tiers with dynamic UI rendering, eliminating unauthorized access pathways and streamlining role-based workflow management.
- Managed complex, high-concurrency global state for a live sports betting platform using Redux Toolkit, handling parallel REST API calls and resolving critical state inconsistency bugs impacting real-time bet data.
- Refactored 30+ legacy class components into modular, reusable functional components with React Hooks, reducing codebase size by ~25% and accelerating feature development velocity for the broader team.
- Integrated REST APIs using Axios with centralized error handling, request interceptors, and optimistic UI loading states, improving perceived application performance and reducing user-facing error rates.
- Collaborated in Agile sprints with backend developers, QA engineers, and product managers to ship production features on schedule across 3 concurrent client projects.

KEY PROJECTS

HRMS — AI-Powered Recruitment Platform | *React.js · Redux Toolkit · Material UI · REST APIs · TypeScript*

- Architected an end-to-end recruitment pipeline from job requisition and candidate application through multi-stage interview and selection workflows, supporting concurrent hiring processes for multiple departments.
- Integrated an AI-powered job description generator via REST API, automating hiring content creation and reducing average JD drafting time from ~45 minutes to under 2 minutes.
- Implemented a 3-tier RBAC system (Admin / HR Manager / Candidate) with granular permission-based UI rendering, ensuring sensitive recruitment data visibility is strictly enforced at the component level.
- Designed scalable, modular frontend architecture with lazy loading and code splitting, establishing reusable patterns that cut estimated onboarding time for new engineers by 30%.

Betting World (Tung247) — Admin & User Betting Platform | *React.js · Redux Toolkit · WebSocket · Context API*

- Built a high-scale, multi-panel betting platform supporting 6 bet types (Straight, Parlay, Teaser, IfBet, Against-Result, PropFecta) and a 4-tier user hierarchy (Admin → Bookie → Agent → Customer).
- Implemented real-time odds updates and live bet synchronization using WebSocket integration, achieving sub-200ms UI refresh latency and ensuring data consistency across concurrent active users.
- Architected complex nested state management combining Redux Toolkit (global betting state) and Context API (session/user context), supporting simultaneous multi-sport market management without performance degradation.

- Developed admin configuration panels for limits, juice percentages, and risk control settings across sports and markets, giving operators granular real-time control over platform risk exposure.

CloudPouss — Elder Care Service Platform | *React.js · Next.js · Firebase · Tailwind CSS · REST APIs*

- Built a real-time 1:1 chat and price negotiation system using Firebase Realtime Database, enabling seamless Elder–Professional communication with instant message delivery and dynamic offer/counter-offer workflows.
- Implemented full negotiation lifecycle (offer → counter-offer → acceptance → payment trigger) synchronized with service booking state, reducing user drop-off in the booking funnel by improving flow continuity.
- Developed the admin panel (React + Tailwind CSS) for user management and platform activity monitoring, providing operators with live insight into bookings, disputes, and service fulfillment status.
- Diagnosed and resolved critical frontend performance issues in the web application, improving Lighthouse performance score and reducing initial page load time through component memoization and lazy loading.

EDUCATION

Bachelor of Engineering — Information Technology

2021 – 2025

Sardar Vallabhbhai Patel Institute of Technology (SVIT), Vasad, Gujarat

HIGHLIGHTS & ACHIEVEMENTS

- Delivered 3 production-grade applications within first year of professional experience across HRMS, real-time betting, and elder care domains.
- Reduced team development time by ~20% through systematic component refactoring and reusable architecture patterns adopted across multiple projects.
- Proficient in full MERN stack development with growing backend capabilities in Node.js, Express.js, and MongoDB.
- Strong advocate for performance optimization: regularly applies code splitting, memoization, lazy loading, and virtualization techniques in production builds.
